

LedCyc9* RGBW

The LedCyc9*RGBW panel is a powerful, modular backlight system for rear projection on cyclorama material and other projection surfaces. It creates a completely even and flicker free field of light.

Each panel integrates 9 symmetric high power RGBW LED pixels, each capable of producing any colour temperature across the entire spectrum of visible light. The unique mounting system ensures a fast setup as well as great optical design for all stage settings.

The panel is developed for use in the theatre, entertainment and Film/TV market.
